Profile

Junior Full Stack Developer focused on Frontend (React/Next.js) and Backend (Node.js/Express). Experience building MERN-style applications, integrating REST APIs, JWT authentication, and role-based access control (RBAC).

Skills

Frontend: React, Next.js, JavaScript, TypeScript, HTML5, CSS3, Tailwind CSS, Vue, Angular.

UI/UX and good practices: Responsive design (mobile-first), API consumption, state handling (loading/error/empty), reusable components, accessibility (semantic HTML and basic ARIA), performance optimization (Lighthouse, reducing re-renders).

Testing and tooling: Jest/Vitest, React Testing Library, Playwright/Cypress, ESLint, Prettier.

Backend (integration): Node.js, Express.js, REST API design and implementation, JWT, RBAC (roles/permissions).

Databases: MongoDB, PostgreSQL (data modeling, **CRUD** operations, and backend integration). **CQRS** (separating commands and queries).

DevOps / tools: Git/GitHub, Linux, Docker, Postman.

AI (applied): Prompt engineering, LLM API integration, tool-use / function calling, basic RAG (embeddings + search), **MCP (Model Context Protocol)** (experimenting with MCP tools/servers).

Soft skills: Commitment, responsibility, motivation, continuous learning, effective communication, active listening, adaptability, and problem solving.

Education

B.Eng. in Intelligent Systems Engineering — Universidad Autónoma de San Luis Potosí 06/2020 – 06/2025
SLP, Mexico

Completed coursework; currently pending degree (internship completion letter available).

Relevant areas:

Web and mobile development; database management; data structures; object-oriented programming; cybersecurity principles; cryptography; high-performance computing; operating systems; network design and implementation; algorithmic complexity; applied software projects.

Professional Experience

Junior Full Stack Developer — CNS – Centro Nacional de Supercómputo, IPICYT 08/2023 – Present
SLP, Mexico

Worked with the MERN stack (MongoDB, Express.js, React, Node.js) through hands-on development and ongoing learning, with support from experienced mentors. Also gained experience with Linux server administration and container management to support more stable and scalable solutions.

Projects

“cnsProfile” — CNS internal application

Built a full-stack web application using the MERN stack (MongoDB, Express.js, React, Node.js) to manage institute staff information. The system collects and organizes employee activity data, including weekly working hours, vacation days, and general staff details. It also allows activity reporting, helping administrators review staff activity over time.

The platform uses secure authentication practices such as JWT (JSON Web Token) for session handling and role-based access control. The data structure also supports future work such as KPI tracking and process improvements.

Key points:

- Centralizes staff data, including schedules, vacations, and activity records.
- Uses JWT-based authentication and role permissions to control access.
- Stores structured activity data to support KPI tracking and performance review.

“Riot Fame” — League of Legends stats application

Built Riot Fame, a personal web project that uses the official Riot Games API to fetch and display player statistics for League of Legends. The app lets users search summoners and view match history, ranked data, and performance details using endpoints provided by Riot’s developer platform.

Key points:

- API integration to fetch and process JSON data from Riot REST endpoints.
- Dynamic rendering and UI built with React.js.

- Async requests and error handling for a smooth user experience.
- Focus on responsive layout and data visualization.
